

The Philosophers' Stone

We are frequently asked about what can be refined

During manufacturing, gold dust clings to clothes, bottoms of shoes and permeates the air. Efforts to entrap these particles will be rewarded. Here are a few hints:

- Clean out your lap tray frequently – if you use a paper towel to wipe your bench, *refine* it.
- Vacuum your shop regularly. *Refine* your vacuum cleaner bags.
- Have a small rug by the shop door to collect gold from shoes. *Refine* it and replace it.
- When you change the filters in your polishing machines *refine* them.
- If you renovate your shop, wash down the walls. *Refine* whatever you've used to wash them.
- If you replace your carpet – *refine* it.
- Have a settling tank installed in the lines under your sinks – you'll be surprised what accumulates.
- Prevent losses on clothing through the use of aprons. Smooth plastic ones are ideal. Alternatively if you use fabric aprons send them in for *refining* and not home to be washed.

Just a note; we have even recovered gold from a manufacturer's chair that had done a few hard yards.

Handy Hint:

To collect the sludge from the ultrasonic cleaner, use a strainer and coffee filters. Place the filters in the strainer and pour the solution through the filters. Wipe the tank with the filters or a paper towel and keep them for refining in your sweeps material.
